overlaps the one farther the stem apex (or would if they were close enough).

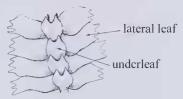

Tooth Small, tapering projection on margin of leaf or thallus, consisting of one or a few cells, or formed by an extension of a cell wall.

**Transverse** Having the join between the leaves and stem running sideways across the stem, not angled.

**Trigone** Triangular to cordate thickening at the point where three cells join.

Underleaves Leaves of a different size (usually much smaller) and shape than the lateral leaves, and attached on the ventral side of the stem.

**Ventral** On the underside of the thallus or shoot, i.e. closest to the substratum.

transverse leaves

# Studies on Victorian bryophytes 6. Key to thallose liverworts and hornworts

# David Meagher

School of Botany, The University of Melbourne, Victoria 3010

#### Abstract

A new key to the genera and many species of thallose liverworts and hornworts (except *Fossombronia* and *Riccia* species) in Victoria is provided. (*The Victorian Naturalist* 123 (4), 2006, 247-254)

#### Introduction

This artificial key complements the key to the genera of leafy liverworts in this volume. It is based on the key to southern Australian liverworts in Scott (1985), but is substantially updated and revised to take into account taxonomic changes and additions to the Victorian flora in the last 20 years. Common mistakes are allowed for in the main key and group keys.

The key can be used to identify specimens to species level, except for species of *Fossombronia* (which are very difficult to identify without detailed analysis) and *Riccia* (which is under review in Australia and is likely to undergo substantial changes). Also keep in mind that species and genera presently known only from

Tasmania, New Zealand or other parts of the world might still be found in Victoria. This key is not valid for other regions of Australia.

Most of the thallose liverworts and hornworts in Victoria are described and illustrated in Scott (1985) and Mcagher and Fuhrer (2003).

Names of taxa follow the current national checklist (McCarthy 2006).

A basic glossary of terms used in this key is included in the key to leafy liverworts (*Studies* 5 in this issue). For a complete and beautifully illustrated glossary of bryological terms, see Malcolm and Malcolm (2000).

# Key to thallose liverworts and hornworts

1	Thallus leafy, or with leaf-like lobes on either side of a central axis2 Thallus lobed or unlobed, but not leafy5
2	Rhizoids crimson
3	Lobes pinnate or alternate, arranged all along the central thallus; or plant leafy or lettuce-like
4	Thallus bright grass-green, thick and fleshy, rather brittle; rare plant
5	Thallus one cell thick (except midrib)
6	Thallus narrow throughout (< 3 mm), lobes pinnate, alternate or bifurcated
7	Growing on wet or dried soil, commonly mud (either saline or fresh); lobe pattern usually not obvious
8	Chloroplasts usually 1 or 2 per cell; capsule erect, needle-like, splitting gradually down from tip; large cavities containing dark cyanobacteria often evident in thallus
9	Thallus half-buried in soil, firmly anchored by copious rhizoids; capsule formed in marsupium buried in soil
10	Thallus surface without pores, upper surface homogeneous, without pores; rhizoids all smooth
	Midrib conspicuous; lamina 1 cell thick in outer parts
12	Plants on bark or rock, never on soil; pale yellow-green, never rose-tinted; prostrate; fine hairs present on ventral surface and usually also on thallus margins

13	Plants with regular, few-celled lobes in the position of leaves and underleaves
14	Sporophyte needle-like; chloroplasts usually 1 or 2 per cell; cavities in thallus containing dark cyanobacteria often present Anthoccrophyta (Group B) Sporophyte not needle-like; chloroplasts usually several to many per cell; cavities in thallus containing dark cyanobacteria never present
15	Gemma cups circular or crescent-shaped, obvious on upper surface of thallus
16	Upper surface of thallus spongy, often whitish
17	Plants usually forming complete or partial rosettes on the ground, or else free-floating; not in salt pans
18	Upper surface of thallus flat, not furrowed: sporophytes carried outside the thallus
19	Thallus usually > 7 mm wide; many long, free rhizoids on ventral surface
	oup A ssombronjaceae
1	Plants aquatic or semi-aquatic; thallus erect, up to 30 mm tall
2	Rhizoids hyaline or brown, never crimson; Thallus ± as long as wide, ruffled and lamellate on dorsal surface
	oup B thocerophyta
1	Chloroplasts 2 or more per cell; capsule with spirally thickened and unsegmented claters
2	Thallus < 25 mm long
3	Thallus with a rough and cavernous surface, usually pale green with crisped margins; spores blackish
4	Plants dioecious

## Group C Hymenophytaeeae and Pallavieinaeeae

Plants with sex organs	
2 Sex organs on specialised short branches at base or on underside of frond	
3 Sexual branches at base of frond; thallus simple or sparsely branched, not palmate	
4 Sporophyte base encased in a thick, fleshy tube bearing archegonia near apex; male plants with scales overlapping midrib dorsally	
5 Thallus branched, margins coarsely toothed	
6 Margins strongly toothed with conspicuous teeth, several cells long	;
7 Thallus ± flat, the margins rarely if ever flexed upwards* Pallavicinia lyelli Thallus commonly concave, the margins flexed upwards Pallavicinia rubristipa	i
8 Frond margins toothed, at least near apex 9 Frond margins entire or nearly so 10	)
9 Margins with teeth of only 1 or 2 cclls**	;
10 Thallus, commonly concave, the margins flexed upwards <i>Pallavicinia rubristipa</i> Thallus ± flat, the margins rarely if ever flexed upwards	1
Fronds borne on erect stalks; plant completely green <i>Hymenophyton flabellatnus</i> Fronds prostrate; plant may have a rose-pink tinge	
12 Stalk rose-pink, at least near base — Pallavicinia lyello Stalk completely green — Podonitrium phyllauthus	i

<sup>\*</sup> Schuster (1991) gave the name *Pallavicinia pseudolyellii* to Australasian material of '*P. lyellii*' and gave a Latin diagnosis, but did not validate the name by nominating a type.

\*\* Jensenia connivens, discounted from the Australian flora by Schaumann et al. (2004), would key to couplet 9; it has fronds borne on erect stalks but is tinged rose red below.

### Group D Sphaerocarpales

### Group E Metzgeriaceae

- 6 Midrib covered by 2 cells on ventral side\*\* ...... Metzgeria decipiens Midrib covered by (3–)4 cells on ventral side ...... Metzgeria furcata

#### Notes:

Cells covering the costa should be counted about half way between one thallus branch and the next.

- \* Metzgeria sp. A from Carlisle State Park seems closest to M. follicola of Melanesia.
- \*\* So (2002) followed Grolle (2002) in reducing *M. decipiens* to a synonym of *M. furcata*, based on the variability in the number of cells covering the midrib on the dorsal side of the thallus. However, the number of cells on the ventral side seems to distinguish the two clearly. Until a full assessment of the two taxa is made, I prefer to maintain them as separate critities.

## Bryophyte special issue

## Group F Aneuraceae

1	Thallus U-shaped in cross-section, at least near lobe tips 2 Thallus flat or slightly curved in cross-section, never U-shaped 4
2	Thallus margins plane; lobe apices spoon-shaped, often yellowish and bearing gemmae
3	Thallus > 7 mm wide; margins strongly crisped; aquatic plant of alpinc or subalpine streams
4	Apex of thallus not dissected 5 Apex of thallus dissected 8
5	Plant dendroid or semi-dendroid; thallus differentiated into a central stem and branches; lateral branches with evident central strands; cuticle papillose
6	Thallus branches with a wing 1 cell thick; mucilage papillae lateral and ventral only, persisting; shoot calyptra smooth
7	Thallus lens-shaped in cross-section
8	Cuticle striolate or papillose 9 Cuticle smooth 10
9	Cuticle striolate
10	Thallus mean width > 2 mm (usually 3–6 mm); apex deeply dissected
11	Thallus mean width < 1 mm; often with prostrate main branches and erect, pinnately branched (almost palmate) secondary branches; monoccious
12	Thallus mean width > 1 mm; branches prostrate; dioceious

#### Note:

Aneura sp. A is an undescribed species known from the Bogong High Plains, Baw Baw Plateau and Kosciuszko National Park. It is probably also present in New Zealand.

#### Group G Marchantiaceae

•	of thallus not surrounded by polygonal shapes
2	Ventral scales forming a narrow crimson stripe down the centre of the underside of the thallus; archegoniophore lobes flat, rectangular
	Colour of upper surface of thallus evenly green; surface with a glossy sheen; marginal scales not projecting beyond thallus edge
1	Plants free-floating
1	Plants on soil or mud
2	Ventral scales conspicuous, purplish
3	Thallus heart-shaped; on drying mud; ventral scales purplish, in bunches

Gemma cups (if present) crescent-shaped; porcs on upper surface

Dorsal surface of thallus with compact tissues forming

narrow vertical air chambers, without specialised pores;

Dorsal surface of thallus with loosely arranged (often spongy) tissues forming polyhedral or large and irregular air chambers with well-defined pores; epidermal cells chlorophyllose

4

### Group I

## Aytoniaeeae and Targioniaceae

## MOSSES OF VICTORIA, WITH BRIEF NOTES BY D. SULLIVAN

'Where to look for them. - On and in the erevices of rocks, on logs, about the bases and roots of trees, on banks of watercourses, lakes, lagoons, and waterholes, on the ground, from the low lands to the summits of our highest mountains - both in wet and dry localities, but more especially in the former, ... I would recommend Melbourne collectors to search well about the Yarra, Dandenong, You Yangs, Mount Macedon, Riddle's Creek, Lancefield (Deep Creek), Sunbury, Gisborne, etc. September, October, and November are the best months for the dry localities, and December, January, and February for the higher mountains and moist forest country. Mosses may be found in certain localities throughout the year, but in winter, except in rare cases, they are not in a lit state for detailed examination, having lost both the calyptras and operculums parts, which are sometimes of great value in deciding specific distinctions.'

From The Victorian Naturalist IV (1887-8), pp. 109-110
